

VLT Instruments 2016

ESO

FORS2 FLAMES VISIR SINFONI

CRIRES UVES VIMOS MUSE

KMOS X-shooter SPHERE HAWK-I

SN Cosmology | Berlin | 15 April 2016

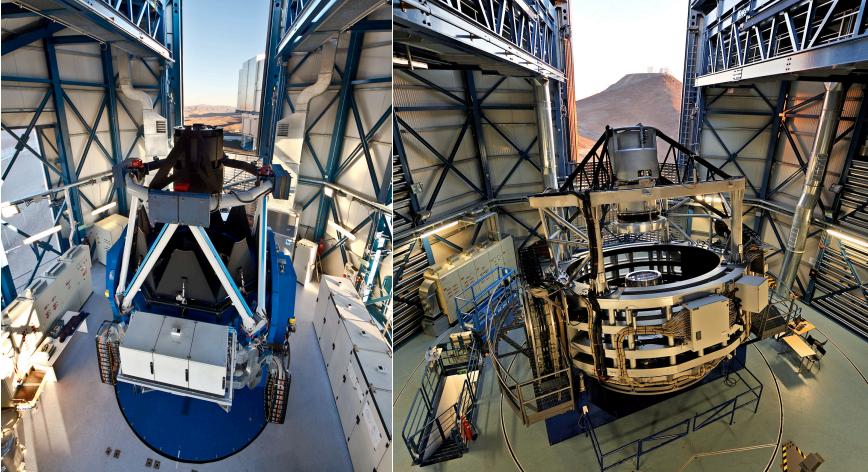

Individual objects

- Most VLT instrumentation is for follow-up observations
- Large instrument complement for nearby SNe
 - NACO – progenitors
 - FORS2 – SN spectra
 - UVES – environments, abundances
 - XSHOOTER – redshifts (CANDELS SNe), late phases
 - VISIR – mid-infrared
 - MUSE – SN environments (SN Refsdal)
 - HAWK-I – near-IR follow-up
 - EFOSC2/SOFI - PESSTO
- ➔ Detailed investigations of individual objects

SN Cosmology | Berlin | 15 April 2016

The Survey Telescopes

- VST 2.6m for optical and VISTA 4.1m for infrared observations
- Coordinated sky surveys in 5-year projects

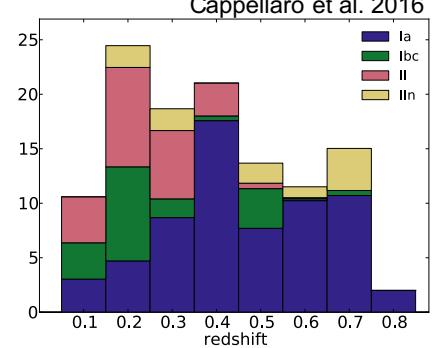

SN Cosmology | Berlin | 15 April 2016

Survey Telescopes

- VST
 - SN search SUDARE
- VISTA
 - WV SNe behind bulge
- VLT follow-up of DES SNe
 - HAWK-I provides IR
 - X-SHOOTER for host galaxy redshifts

Cappellaro et al. 2016

Redshift Range	Ia	Ibc	II	IIn	Total
0.1 - 0.2	3	3	10	2	20
0.2 - 0.3	5	8	7	2	22
0.3 - 0.4	9	2	5	1	21
0.4 - 0.5	12	2	1	1	16
0.5 - 0.6	8	3	0	0	11
0.6 - 0.7	10	0	0	0	10
0.7 - 0.8	2	0	0	0	2

SN Cosmology | Berlin | 15 April 2016

Long-Term Monitoring Programs

■ Supernovae

- Key Program in 1980s
- Several Large Programs
 - Turatto et al., Benetti et al.
- Public Spectroscopic Survey
 - PESSTO
 - 90 nights per year for spectroscopic SN follow-up
 - concentrate on peculiar and rare types of supernovae

SN Cosmology | Berlin | 15 April 2016

Paranal 2020

UT1 (Antu)
CRIRES
KMOS
FORS2

UT2 (Kueyen)
UVES
MOONS
X-shooter

UT3 (Melipal)
VIMOS
SPHERE
VISIR/CUBES

UT4 (Yepun)
MUSE
HAWK-I
ERIS
AOF

VISTA
4MOST

ESPRESSO

VLTI
GRAVITY
MATISSE
PIONIER

The figure illustrates the ESO Optical/NIR Telescope System at Paranal after 2020. It features a 3D schematic of the telescope complex and a photograph of the actual site.

Paranal >2020

Telescope Layout:

- UT1 (Antu):** CRIRES, KMOS, FORS2
- UT2 (Kueyen):** UVES, MOONS, X-shooter
- UT3 (Melipal):** VIMOS, SPHERE, VISIR/CUBES
- UT4 (Yerun):** MUSE, HAWK-I, ERIS, AOF
- VISTA:** 4MOST
- ESPRESSO**
- VLTI:** Amber, GRAVITY, MATISSE

Photograph of Paranal Observatory:

The photograph shows the Paranal Observatory on a hillside under a clear sky. Annotations indicate the locations of the 3.6m/Exoplanets and NTT Transients telescopes.

The ESO Transient Sky

- Traditionally challenging for community observatories
- Adapt operational modes
 - flexible scheduling
 - variable timescales
 - large Target of Opportunity fraction
 - rapid response mode
 - ➔ service mode operations
 - ➔ dedicate telescopes
- Systematic archiving
 - time series

Strategic Changes - next decade

- Move towards a systems approach
 - Big problems need coordinated observations
 - Milky Way dynamics
→ Gaia astrometry plus velocities and abundances
 - Cosmology
→ EUCLID and redshifts
 - Particle Physics
→ messengers and electromagnetic follow-up
 - Coordination between different observatories
 - Multi-wavelength and multi-messenger approach
 - Complex astrophysical sites
→ e.g. star formation regions, SN remnants, galaxy clusters, distant universe

SN Cosmology | Berlin | 15 April 2016

SOXS on the NTT

- Negotiations with a consortium to provide a single-object spectrograph for the NTT - SOXS
 - copy of Xshooter
 - simultaneous coverage from 400nm to 1.8μm
 - significant investment of observing time over many years
 - continuation of PESSTO-like survey

SN Cosmology | Berlin | 15 April 2016

Future SN Cosmology

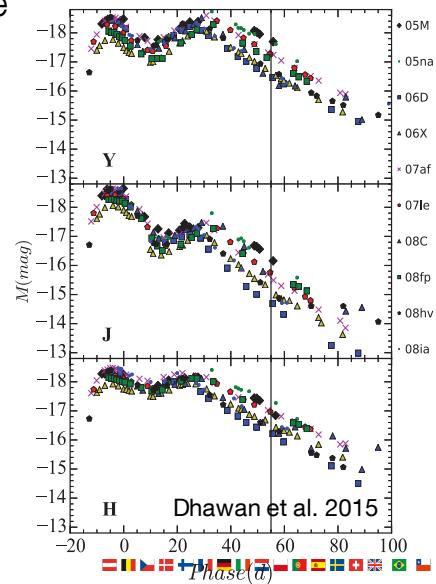

- Promise of the (rest-frame) infrared
 - Reduced absorption
 - Greater uniformity in the light curves

SN Cosmology | Berlin | 15 April 2016

SN Ia infrared light curves

- IR light curves from the literature
 - mostly Carnegie Supernova Project
- Individual evolution after first maximum
- Uniform late decline rate

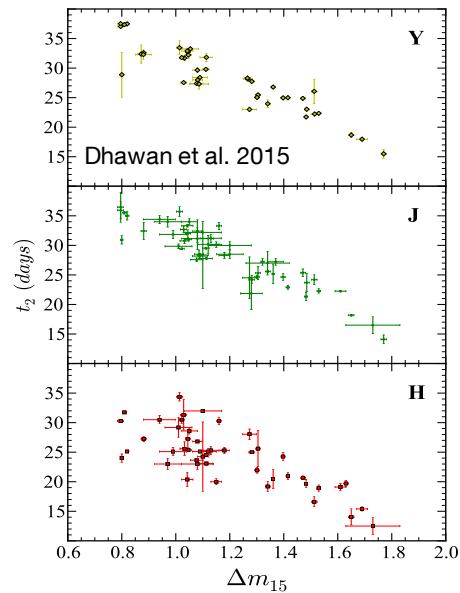

SN Cosmology | Berlin | 15 April 2016

Correlations with the optical

- IR properties correlate with optical decline rate
- Phase of secondary maximum strongly correlated Δm_{15}

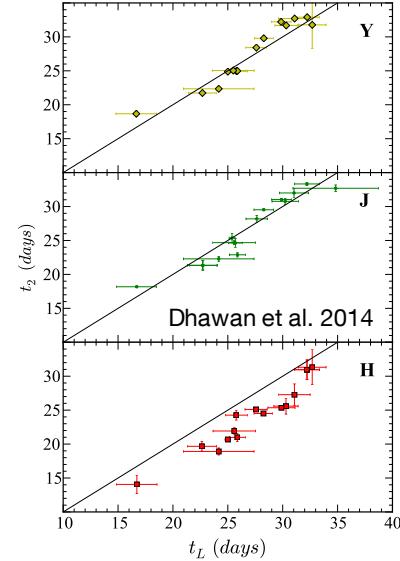

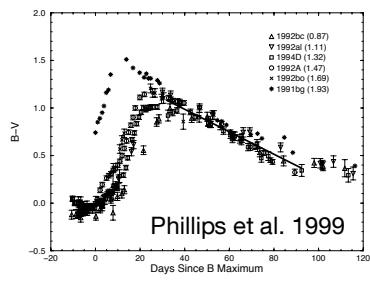

SN Cosmology | Berlin | 15 April 2016

Correlation with colour evolution

Phase of second maximum and beginning of the Lira relation are also tightly linked

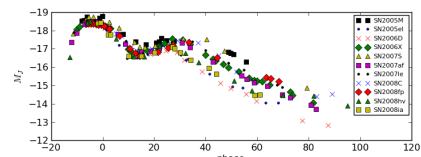

SN Cosmology | Berlin | 15 April 2016

Consistent picture emerging

- Second peak in the near-IR is the result of the recombination of Fe++ to Fe+ (Kasen 2006)
 - he predicted a later second maximum for larger Ni masses
- Optical colour evolution faster for objects with lower nickel mass (Kasen & Woosley 2007)
- Ejecta structure uniform
 - late declines very similar
 - higher luminosity indicates a higher Ni mass
 - later secondary peak also indicates higher Ni mass
 - Ni mass and (optical) light curve parameters correlate (Scalzo et al. 2014)

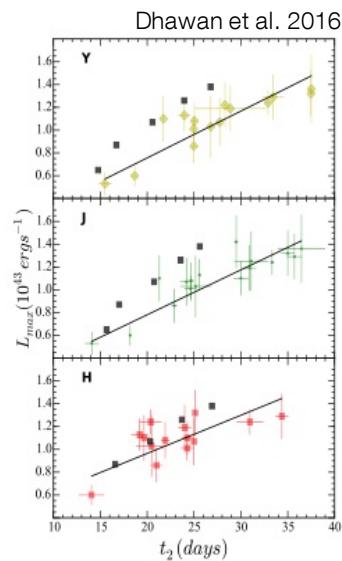

Dhawan et al. 2015

SN Cosmology | Berlin | 15 April 2016

Nickel masses

- Using a timing parameter for nickel masses
 - completely independent on reddening and multiple light curves
- Test with a sample of unreddened SNe Ia
- Explore different methods to calculate the nickel mass (currently still all Chandrasekhar-mass progenitors)

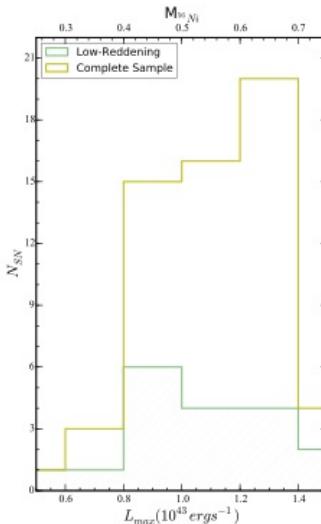

SN Cosmology | Berlin | 15 April 2016

Luminosity and mass functions

- Reddening independent distribution functions
 - fails for super-Chandra objects
 - SN 2007if
 - Different physics?
Interactions?
- Luminosity from second IR maximum?

SN Cosmology | Berlin | 15 April 2016

EUCLID

- Use EUCLID deep fields to provide IR light curves
 - Rest frame Y out to $z \sim 0.8$; J to $z \sim 0.5$
- Monitor/shadow the fields from the ground in the optical
 - Full optical light curves
 - Exact phases
 - Important for the (sparse) IR light curves
- Spectroscopic follow-up programme
 - FORS2 would be ideal

SN Cosmology | Berlin | 15 April 2016

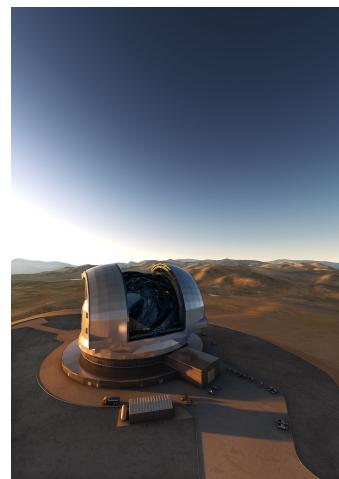

Future Facilities

■ MOONS (VLT) and 4MOST (VISTA)

- Massive multi-object spectrographs
- Follow-up spectroscopy
 - Host galaxies
 - Supernovae?
 - ‘random phase’
 - No systematic follow-up

■ E-ELT

- Operational from 2025
- First-light instruments
 - HARMONI – spectrograph
 - MIKADO – camera (0.8-2.4 μ m)
- Individual objects (0.5-2.4 μ m)
- High redshift

SN Cosmology|Berlin | 15 April 2016

Astronomy in the 2020s

- OIR sky measured to ~25 mag
- Thousands of transient alerts per day
- Matching capabilities at (almost) all other wavelengths
 - angular resolution
 - sensitivity
 - sky coverage
- Astroparticle detections
- Diverse astronomical community with considerable overlap with other sciences (chemistry, biology)
